

Transwater Announces Expansion of Water Services

Now positioned to offer complete Water Logistics & Infrastructure Support

As the oil & gas water sector adjusts to fluid market dynamics the services and support landscape will be stressed while adapting to rapid changes. In an effort to provide a backstop against potential disruption in available vendor resources, Transwater is enhancing product and services offerings through labor and equipment enhancements as well as expanded strategic partner resource capabilities.

“We have a great group of clients who will need to ensure they maintain and protect their critical water assets,” explained Randy Smith, President and CEO of Transwater. “In tough times, vendors that were available to them for a variety of services, may not be in that position in the foreseeable future.” Randy went on to explain that vertical integration of new water related services is a perfect fit for Transwater.

“We developed our customer base with products and services related to mapping and monitoring of water assets,” Randy continued, “Offering additional services to support the complete lifecycle of water through sourcing, drilling, frac, flowback and produced water resources was an obvious next step for Transwater.”

He also related that as budgets are strained, expenses reduced and difficult decisions are made relative to the number of people and resources our customers have counted on in the past, they will have to find creative ways to do more with less! He added that Transwater has prepped their team for a new level of action and responsiveness as current and future clients find themselves in need of extra assistance!

Finally, Mr. Smith noted that “We’re confident that the new services being offered will be a welcome addition to the clients who already have Transwater established as a certified MSA vendor and will be of special interest to new clients looking to simplify vendor sourcing for water services.”

About Transwater

Transwater has become well known across the Permian and beyond for their innovative TransMap and TransWatch solutions. Their less-is-more approach to water monitoring solutions has resulted in an affordable, scale-able and rapidly deployable remote monitoring solution that are easily accessible by their clients on web portals, smartphone app and text alarms & alerts.
